

Instructions for using OpenDNS and DNS-O-MATIC with most Routers for Web Blocking.

OpenDNS Nameservers

208.67.222.222
208.67.220.220

In your Computer>Go To Start>Run>Type CMD>Enter
Type the following in CMD (Command Line) App

Router Access

telnet 192.168.1.254 (Your Router Address)

Login

Username: <Username>
Password: <Password>

Disable Telnet Timeout

env get var=SESSIONTIMEOUT
env set var=SESSIONTIMEOUT value=0
saveall

Set the router to use OpenDNS

dns server forward dnsset list
dns server forward dnsset flush

OpenDNS

dns server forward dnsset add set=0 dns=208.67.222.222 metric=0 intf=Internet
dns server forward dnsset add set=0 dns=208.67.220.220 metric=0 intf=Internet
saveall

Update OpenDNS using Dynamic DNS

dyndns service list
dyndns service modify name=custom server=updates.dnsomatic.com updateinterval=3
saveall

Set Dynamic DNS

Ensure your opendns account is set to -- enable Dynamic IP Update
Go to www.dnsomatic.com , sign in with your OpenDNS username / password.
While there, enable update opendns.
Go to the routers web interface Toolbox > Dynamic DNS > Configure :-
Tick "Enabled"
Interface -- Internet -- See Note (1)
Username -- Opendns username
Password -- Opendns password
Service -- custom
Host -- enter your opendns network label or enter the catch all -- all.dnsomatic.com
Click "Apply"
Check the routers event log to confirm "dyndns host has been updated".

Create a firewall rule to block access to all other DNS resolvers

This prevents any computer on the network from using it's own DNS settings to bypass the opendns web filter.

Login to the routers web user interface and go to Toolbox > Firewall > Configure > Create a new Security Level >
Enter a name
Under "Clone from existing Security Levels:" select "standard"
Click "Apply"
A new firewall settings page will come up, click "Add".

Now fill in the new rule definition:-

Name: -- Block DNS
Enable: -- tick
Source Interface: -- lan
Source Address: -- Any
User-Defined: -- leave blank
Destination Interface: -- wan
Destination Address: -- Any
User-Defined: -- leave blank
Service: -- dns
Action: -- Deny

Clear DNS Resolver Cache

ipconfig /flushdns

Check existing setting.
Disable session timeout.
Make the change permanent.

List all DNS resolvers set in the router
Clear

Set the DNS Service
Make the change permanent

View existing settings -- It's the "custom" section we'll be changing
Change service provider to dnsomatic.com updateinterval is in (seconds)
Make the change permanent
